# SI DOGE MOON LANDING

## ($SI) — OFFICIAL ROADMAP

**READ THE CHART. TAKE THE TRADE.**

A day-trading desk for crypto. The culture is the chart: structure, levels, momentum, and the decision to take the trade or stand down.

## OFFICIAL CONTRACT

**0x3236a40e6d8939861b5b057b8a9a071700996231**

Ethereum · Ticker $SI

Community roadmap. Not financial advice and not a signal service.

## WHAT IS SI DOGE MOON LANDING?

SI Doge Moon Landing ($SI) is a community desk for people who day trade crypto. Members mark levels, share reads, and review what they actually did. The token is the banner. The work is the chart.

## SI — THE STANDARD

Super Intelligence Doge is the face of the desk. The name does not replace a read, and it is not a call to copy.

## THE DESK

The desk is the home for charts, session reviews, and the community. Setups come and go. The room stays. Official contract:

**0x3236a40e6d8939861b5b057b8a9a071700996231**

## THE CREW

The Crew are the traders in the room. They post charts, mark support and resistance, share invalidation, and leave both wins and losses up.

## THE PROBLEM

Most rooms post tickers with no level and delete the losses. People ape what they cannot chart, then leave.

## THE STANDARD

A level and an invalidation come before size. Shared reads. Individual risk.

## THE TRADING LOOP

1. DISCOVER — Find a market with a readable structure. Not every move is a trade.

2. READ — Structure, level, momentum, timeframe, and what would make the read wrong.

3. PLAN — Entry, target, and invalidation in plain language. A call without a level is not a read.

4. TRADE — Members take their own risk. Nobody is required to take the trade.

5. REVIEW — What the level did, whether the plan was followed, and what changes next session.

## CHART WATCHERS

Chart Watchers keep the desk usable. They orient new traders, run open and close threads, and hold the rule that a call needs a chart, a level, and an invalidation.

## PRINCIPLES

- Process over apeing
- Charts in public, including losses
- Own your trade — no one trades your account
- One candle does not build a desk
- Every session should make the next read cleaner

## PHASE 1 — IDENTITY

Make $SI recognizable as a chart desk, not a rocket chat. Lock the language: structure, level, momentum, invalidation, review. Open Telegram and X. Publish the contract. Start a daily open and close.

## PHASE 2 — THE DESK

Add Chart Watchers and channels for majors, alts, and $SI. Use one chart format: bias, level, invalidation, plan. Run review threads. Archive clean reads.

## PHASE 3 — CHART LAB

Post pre-session charts. Members mark their own levels. Separate bias from the trade plan. Only the cleanest setups go to execution.

## PHASE 4 — LIVE SESSIONS

The token is already live. Trade the session in public, $SI included, on one contract. Update the chart as structure changes. Write the lesson before the room moves on.

## PHASE 5 — REPEAT

Review wins and losses in the open. Tighten the format. Add markets the crew can actually read. More members post, not just watch.

## PHASE 6 — THE CREW

A desk known for reading crypto charts and taking trades with a process. Archives, recaps, and a site that holds the standard and the contract. Trust comes from leaving the losses up.

## PHASE 7 — MULTI-CHAIN LAUNCHES

Launch $SI on additional chains (Base, Solana, and others as the crew can read them). The Ethereum contract remains the primary for this deployment. Each new deployment publishes its contract, maintains the same chart-desk language, and opens its own session threads. Cross-chain presence expands the room without replacing the standard.

## PHASE 8 — VERIFIED HOLDER AIRDROPS

Airdrops to verified holders of the core $SI. Snapshots capture wallets that hold the official contract. Verification requires on-chain proof of holdings or a signed message from the wallet. Airdrops (multi-chain versions or ecosystem tokens) go only to verified addresses. The desk reviews distribution the same way it reviews any level — publicly, with the numbers left up.

## PHASE 9 — CREATOR SUPPLY BURNS

Scheduled supply burns of creator holdings. A public burn schedule is published with dates, amounts, and the destination (burn address). Each burn is executed on-chain and linked in the desk. The crew marks the supply change as a level and reviews what it did to structure. Creator allocation is reduced on a fixed cadence so the desk can chart the effect.

## CLOSE

Not every read wins. Day trading crypto can lose money. Memecoins can go to zero. Multi-chain launches, airdrops, and burns do not change that. The point is a room that keeps charting.
